REPORT SUMMARY

On November 18, 2024, ArborPro, Inc. began operations on a comprehensive GPS Tree Census for the City of Ojai. ArborPro assigned three ISA Certified Arborists to perform the survey. A total of 4445 sites were reviewed, encompassing 4267 trees, 159 stumps, and 19 vacant sites.

The purpose of this report is to summarize the findings of the tree census. ArborPro identified 157 distinct species throughout the city with the top 3 species being Coast Live Oak, Valley Oak, and California Pepper respectively. Overall, the inventory of trees is in good shape with almost 93% of the trees recorded with a Good or Fair condition rating. Our data shows over 92% of trees were marked for Routine or Training Prune, which means that most trees need minor pruning to ensure maximum life expectancy. Our Arborist helped provide insight onto any abnormalities for the trees included in the inventory by providing 47 different observations. The top 3 observations are Deadwood/Clean, Pruned for Utilities, and Previously Topped respectively.

Total: 4445

Trees:
4267

Stumps:
159

**Vacant
Sites:**
19

COLLECTION AREA

The collection area was located within the public right-of-way area that is maintained by the City of Ojai. The collection focused on street tree inventory, separated into 20 zones set by the City. The ArborPro Arborists conducted a 360° visual inspection of the site. The data was inputted onto ArborPro Software, including GIS location. No harm was inflicted on the trees during the assessments. Any tree with limited access was visually estimated and assessed.

The closest parcel address was recorded, including property address number, property street name, on street name, and side of the property where the site is located. In the case where there was no clear property address, fictitious addressing was assigned adhering to on street addressing progression.

Hardscape damage was recorded if the concrete crack had a greater than 1 inch lift and was considered a trip and fall hazard. Overhead primary utility lines within interference distance from the tree trunk and branches were also identified; however secondary utility lines, communication lines, house drops, and/or other low voltage lines were not documented. The site hardscape type and potential grow space size were recorded to indicate root zone capacity, irrigation limitations, and land use possibilities. Grow space type includes but not limited to treelawn, tree well, behind treelawn, curb and gutter, unimproved, median, encroached, monolithic, etc. Safety clearance issues were also listed and considered into the recommended maintenance for the site.

COLLECTION METHODS

Three site types were collected: Tree, Stump, and Vacant Site. Tree sites have an active tree present that requires regular maintenance work. Stump sites indicate the tree is removed but the stump and roots are left behind. Vacant sites are suitable and ready for tree planting.

Tree species was determined based on a combination of leaf morphology, bud and flower formation and coloration, bark and seed appearance, and tree form. Both common and botanical name of species were recorded.

The diameter at breast height (DBH) was measured at 4.5 feet above the ground and the number of trunks, up to 9, were recorded. In instances of co-dominant trees or dwarf trees, number of trunks was determined at 2 feet above ground, roughly knee height, and DBH was measured prior to trunk and branch separation. If the tree had more than one trunk, the largest trunk DBH was recorded. Tree height was determined using forestry laser range finder and crown width was recorded.

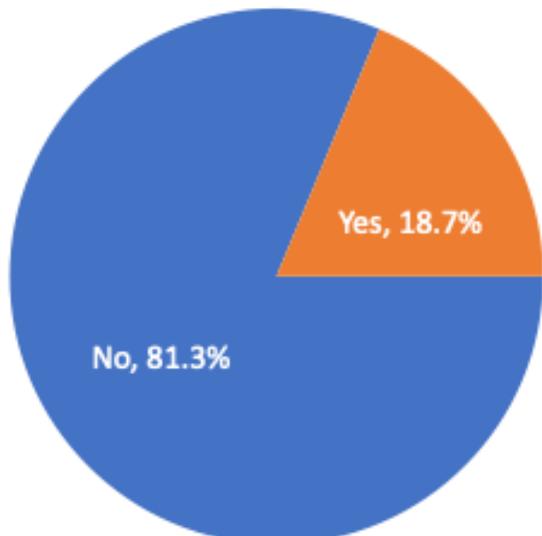

The tree health condition was determined by assessing crown, trunk, and root health. Maintenance was recommended based on tree health and the functionality of the tree, such as for structural and/or aesthetic purposes. Other additional tree information was recorded under observation and notes.

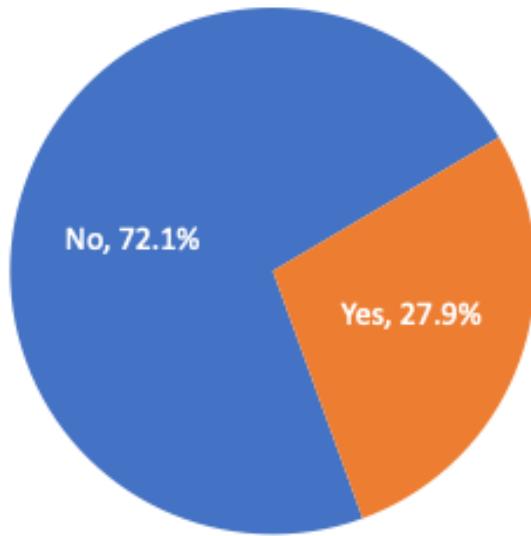

INVENTORY SUMMARY

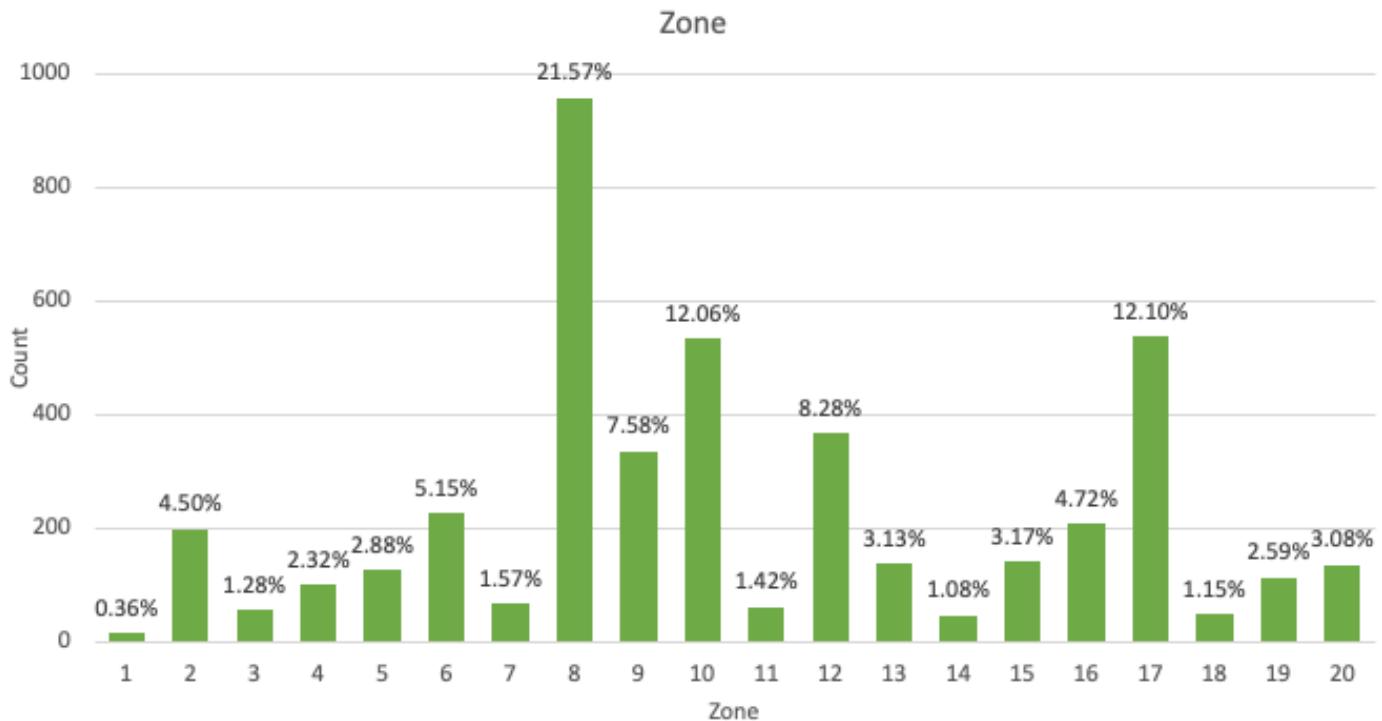

Out of the 4445 sites surveyed, 19% of sites have hardscape damage present and 28% have primary utility present over top. Tree well has the highest percentage of hardscape damage at over 63% followed by Treelawn where nearly 43% of sites have hardscape damage.

Hardscape Damage

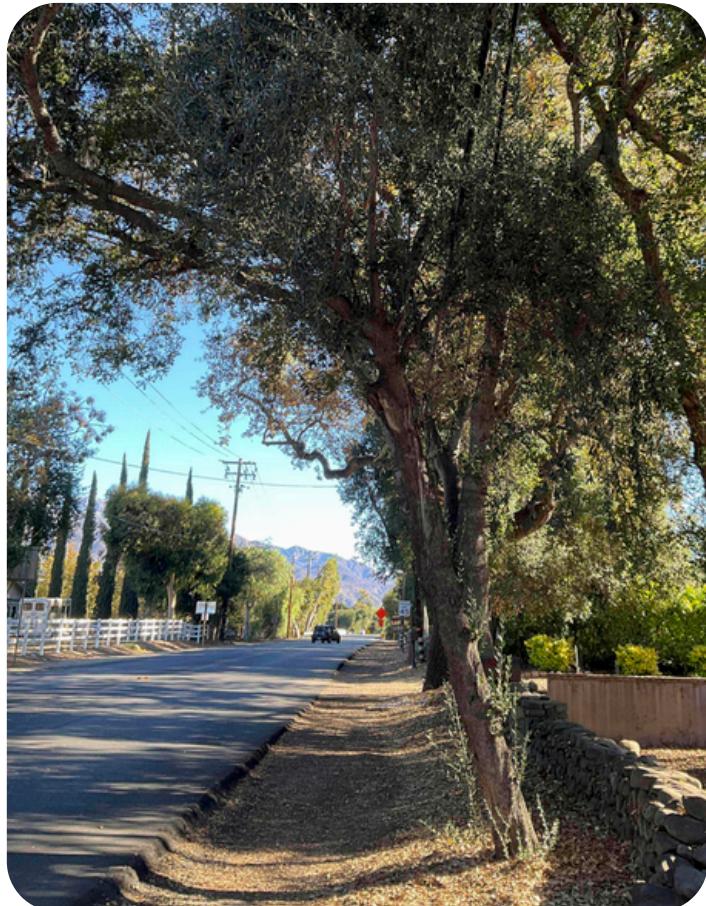

Utility Presence

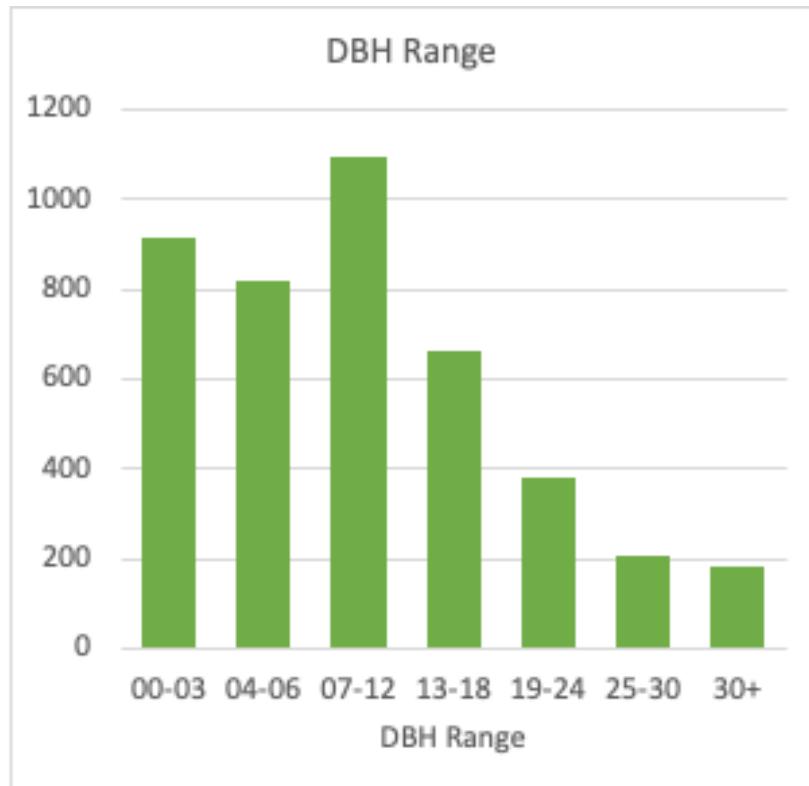

Zone 8 has the most number of sites followed by Zone 17 and Zone 10. The most common growspace type is Unimproved, where no curb, gutter, or sidewalk is present.

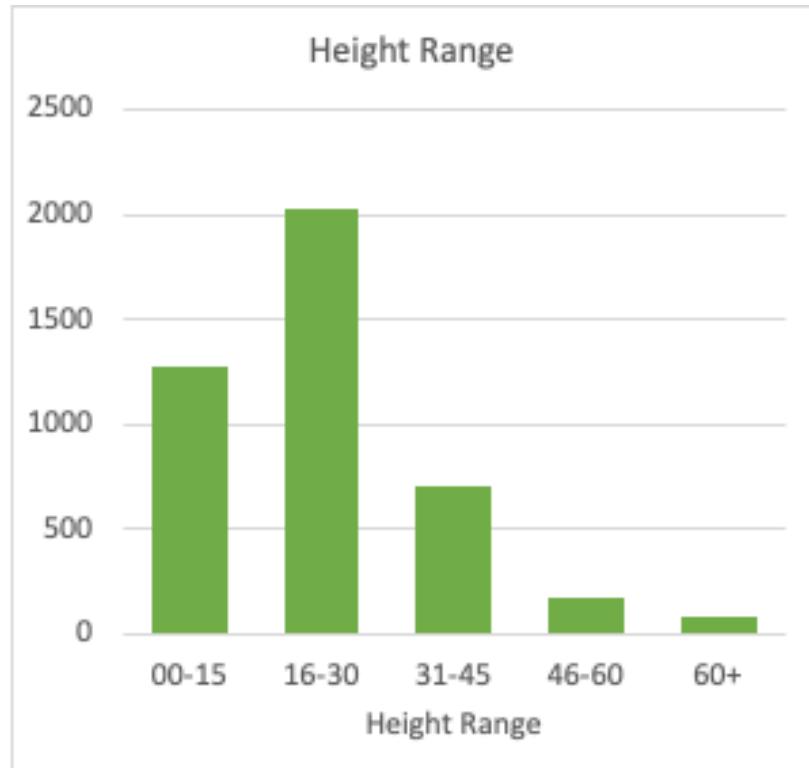

Growspace Type	Count	Percentage
Unimproved	1688	37.98%
Curb & Gutter	1445	32.51%
Treelawn	556	12.51%
Monolithic	379	8.53%
Encroached	172	3.87%
Tree Well	121	2.72%
Median	70	1.57%
Behind Treelawn	14	0.31%
Grand Total	4445	100.00%

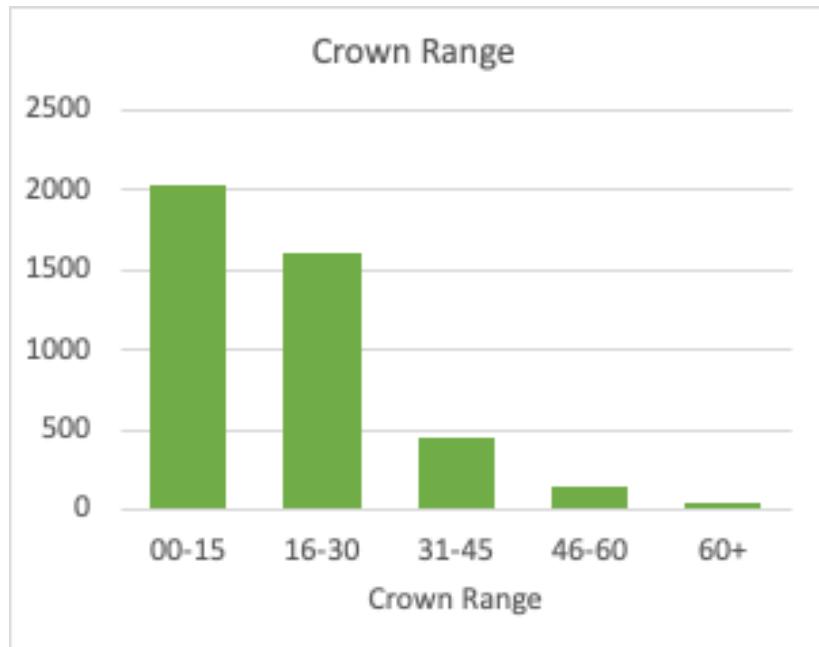

DBH Range	Count	Percentage
00-03	912	21.37%
04-06	821	19.24%
07-12	1095	25.66%
13-18	664	15.56%
19-24	380	8.91%
25-30	209	4.90%
30+	186	4.36%
Grand Total	4267	100.00%

Height Range	Count	Percentage
00-15	1277	28.22%
16-30	2023	45.69%
31-45	712	18.86%
46-60	172	4.77%
60+	83	2.46%

00-15	2036	45.99%
16-30	1605	37.25%
31-45	451	11.61%
46-60	139	3.97%
60+	36	1.17%
Grand Total	4267	100.00%

Excellent – The tree is near perfect condition; this determination is generally used for trees with no defects and young trees that have been properly maintained.

Good – The tree has no major structural problems; no significant damage from diseases or pests; no significant mechanical damage; a full, balanced crown, and normal twig condition and vigor for its species.

Fair – The tree may exhibit the following characteristics: minor structural problems and/or mechanical damage; significant damage from non-fatal or disfiguring diseases; minor crown imbalance or thin crown; minor structural imbalance; or stunted growth compared to adjacent trees.

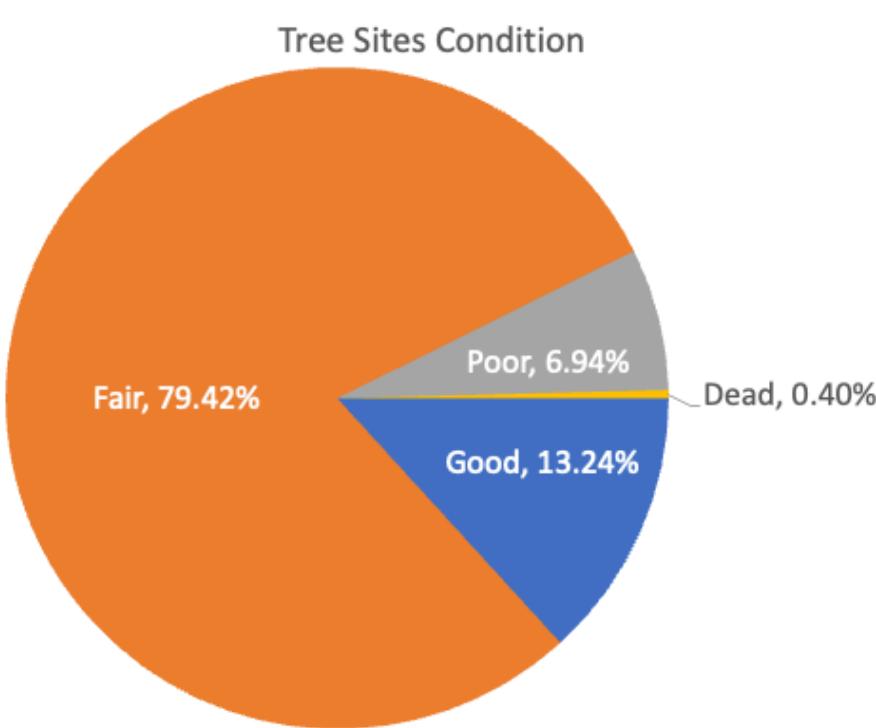

Poor – The tree appears healthy, but may have structural defects. This classification also includes healthy trees that have unbalanced structures or have been topped. Trees in this category may also have severe mechanical damage, decay, severe crown dieback or poor vigor/failure to thrive.

Critical - The tree has severe structural defects or mechanical damage. The tree is considered unsafe and require immediate tree work.

Dead – Trees in advanced states of decline are not included. This category refers only to dead trees.

Stump - for stump sites; Tree has been removed, leaving only the stump.

Vacancy - for vacancy sites; location identified as good site to plant new trees.

Tree Condition	Count
Good	565
Fair	3389
Poor	296
Dead	17
Stump	159
Vacancy	19
Grand Total	4445

Priority 1 Removal - Trees designated for removal have defects that cannot be cost- effectively or practically treated. The majority of the trees in this category has a large percentage of dead crowns and poses an elevated level of risk for failure. Any hazards that could be seen as potential dangers to persons or property and seen as potential liabilities would be in this category. Large dead and dying trees that are high liability risks are included in this category.

Priority 2 Removal - Trees that should be removed but do not pose a liability as great as the first priority will be identified here. This category would need attention as soon as "Priority One" trees are removed.

Priority 1 Prune - Trees that require priority one pruning are recommended for trimming to remove hazardous deadwood, hangers, or broken branches. These trees have broken or hanging limbs, hazardous deadwood, and dead, dying, or diseased limbs or leaders greater than four inches in diameter.

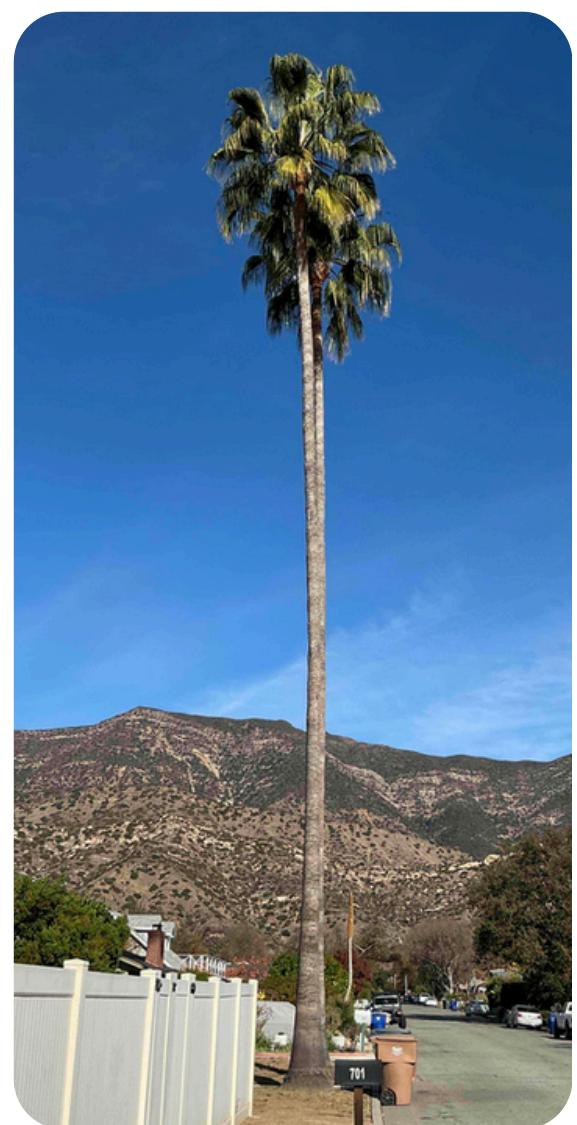

Priority 2 Prune - These trees have dead, dying, diseased, or weakened branches between two and four inches in diameter and are potential safety hazards.

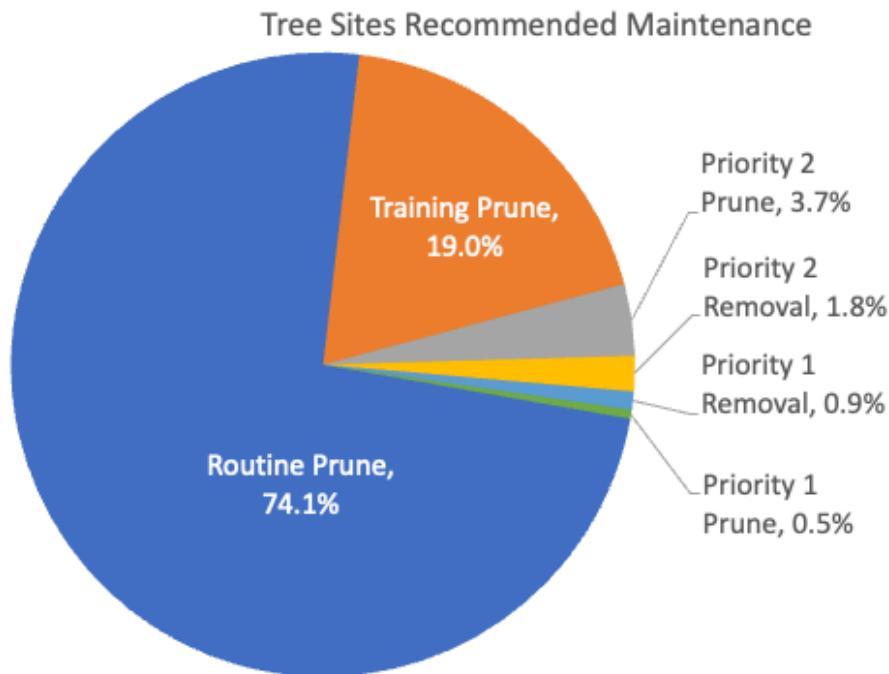

Routine Prune - These trees require routine horticultural pruning to correct structural problems or growth patterns, which would eventually obstruct traffic or interfere with utility wires or buildings.

Training Prune - Young, large-growing trees that are still small must be pruned to correct or eliminate weak, interfering, or objectionable branches in order to minimize future maintenance requirements. These trees, up to 20 feet in height, can be worked with a pole-pruner by a person standing on the ground.

Stump Removal - This category indicates a stump that should be removed.

Plant - During the inventory, vacant planting sites will be identified by street and address. The size of the site is designated as small, medium, or large (indicating the ultimate size that the tree will attain), depending on the growing space available and the presence of overhead wires.

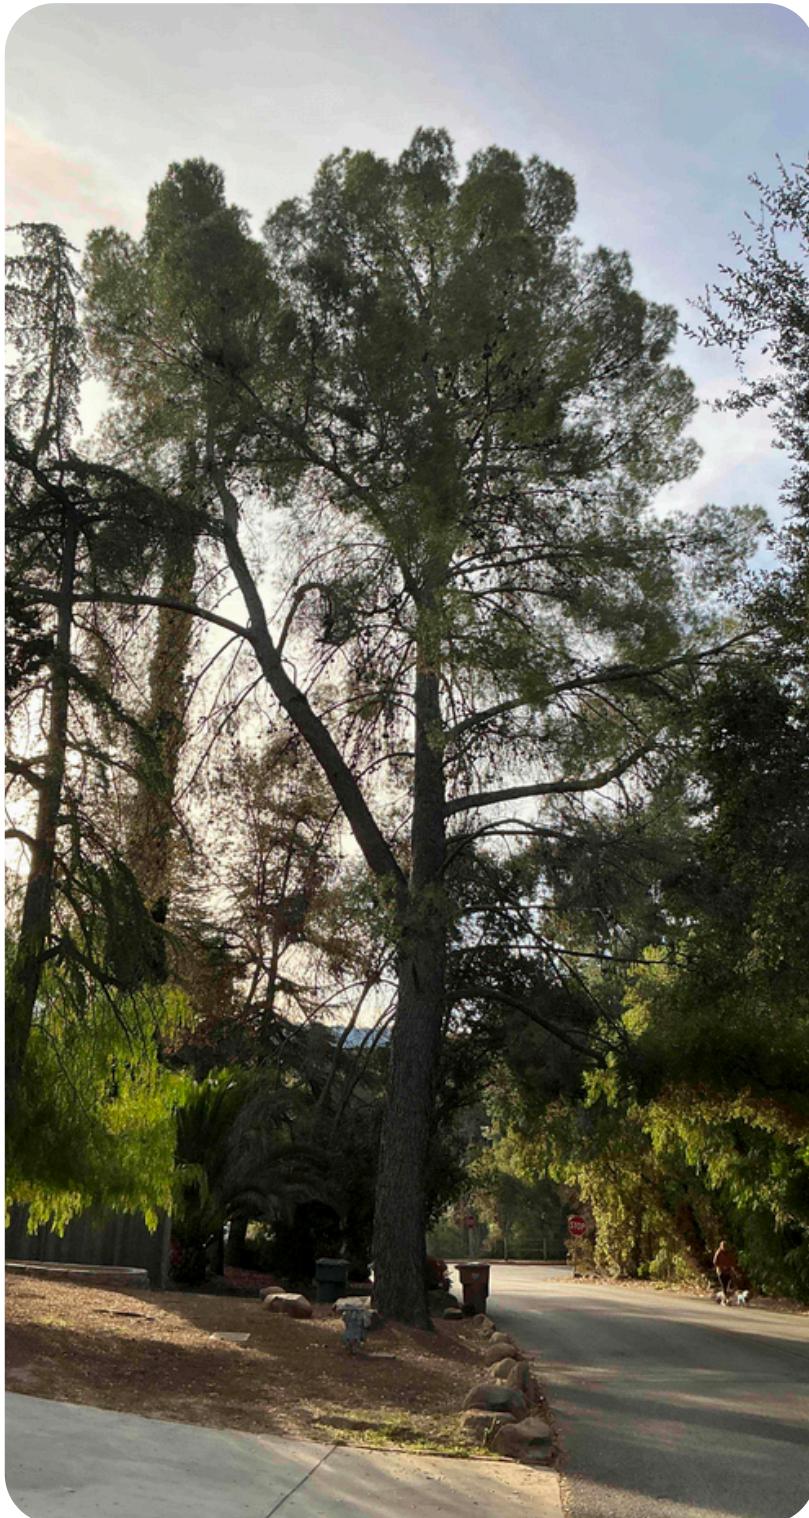

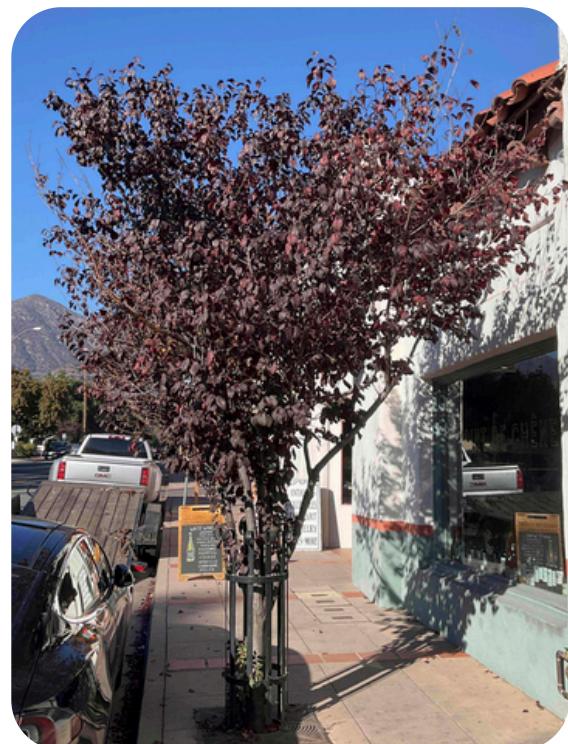

Recommended Maintenance	Count
Routine Prune	3161
Priority 2 Prune	158
Priority 2 Removal	78
Training Prune	810
Priority 1 Prune	20
Stump Removal	159
Priority 1 Removal	40
Plant	19
Grand Total	4445

Observations help describe any common abnormalities in the inventoried tree. These are ISA terms that help indicate structural, health, or pest issues found in or around the tree. Top 10 most frequently used observations are listed below. List of full observation tree count can be found in Appendix A.

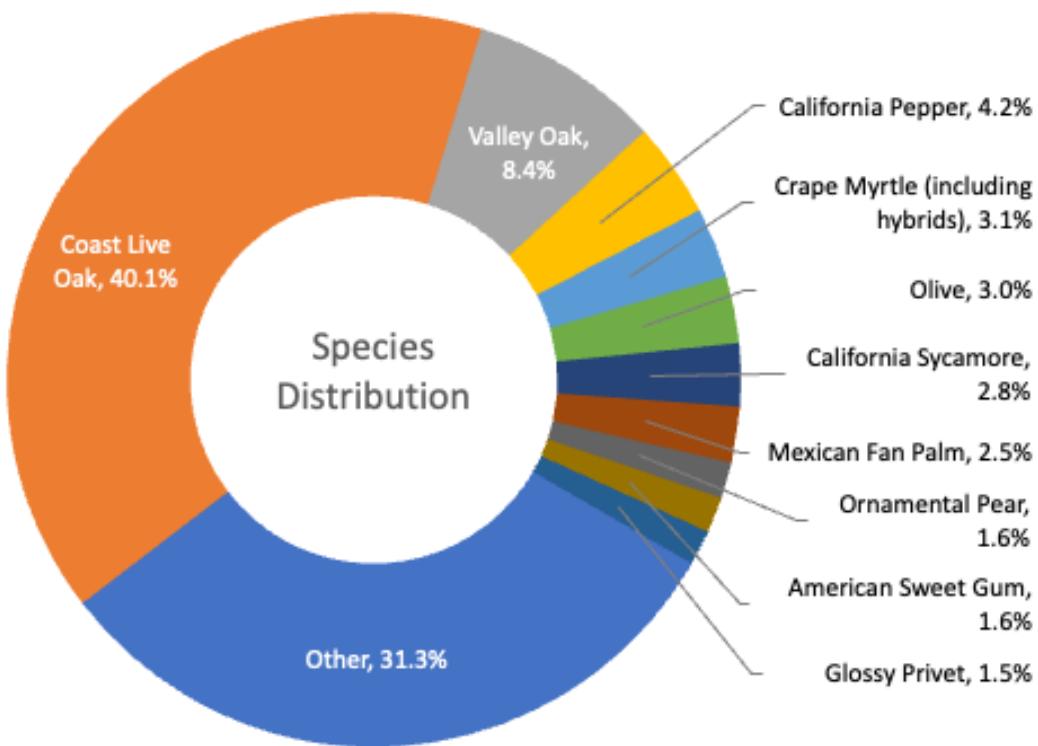

Top 10	Observation	Count
1	Deadwood/Clean	113
2	Pruned for Utilities	92
3	Previously Topped	39
4	Volunteer(s)	33
5	Prior Failure(s)/Tear Out(s)	27
6	Basal Decay	20
7	Cavity	19
8	Remove Basal Suckers	18
9	Stump Sprout(s)	17
10	Sparse Crown	16

There are a total of 157 distinct species identified in the inventory. The top 10 most common species throughout the City, displayed on the table to the right, represent over 68% of the all tree sites. List of full species tree count can be found in Appendix B.

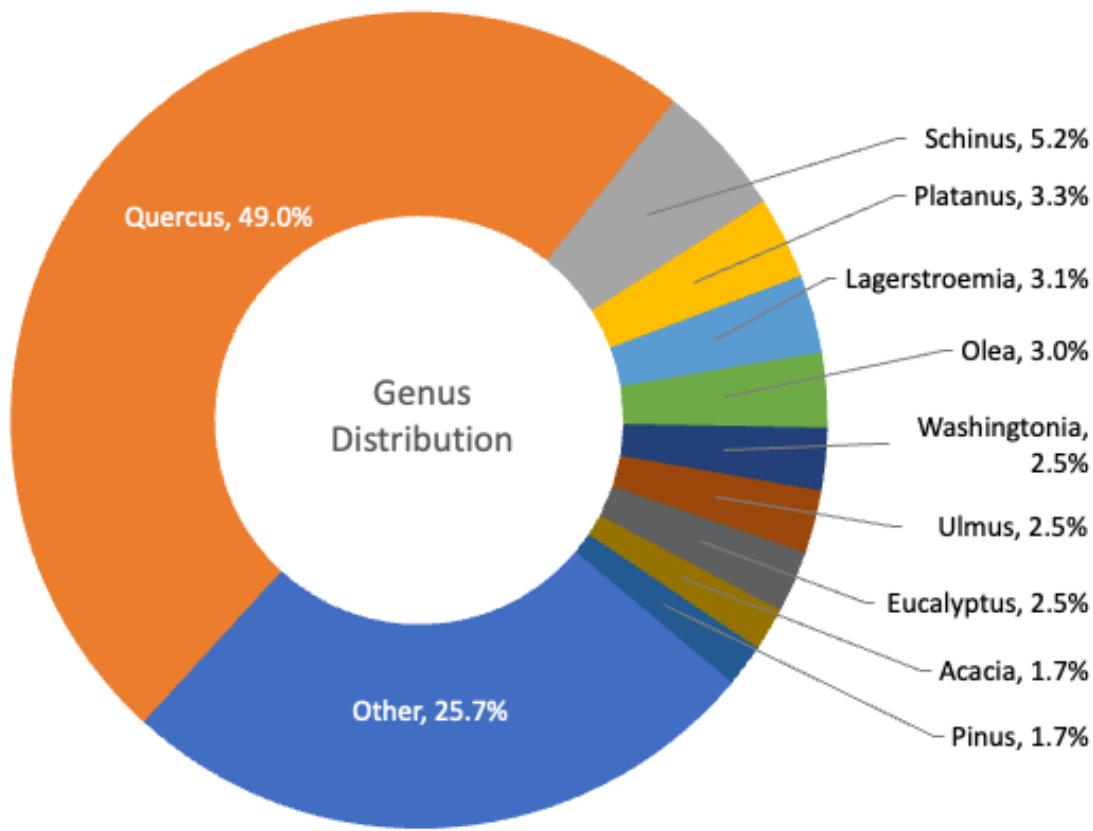

Top 10	Common Name	Count	Percentage
1	Coast Live Oak	1713	40.15%
2	Valley Oak	360	8.44%
3	California Pepper	178	4.17%
4	Crape Myrtle (including hybrids)	132	3.09%
5	Olive	126	2.95%
6	California Sycamore	118	2.77%
7	Mexican Fan Palm	105	2.46%
8	Ornamental Pear	68	1.59%
9	American Sweet Gum	67	1.57%
10	Glossy Privet	66	1.55%

The 157 distinct species belong in 91 distinct genus. The top 10 most common genus, displayed on the table below, represent over 74% of the all tree sites.

Top 10	Genus	Count	Percentage
1	Quercus	2089	48.96%
2	Schinus	224	5.25%
3	Platanus	139	3.26%
4	Lagerstroemia	132	3.09%
5	Olea	126	2.95%
6	Washingtonia	106	2.48%
7	Ulmus	106	2.48%
8	Eucalyptus	105	2.46%
9	Acacia	73	1.71%
10	Pinus	72	1.69%

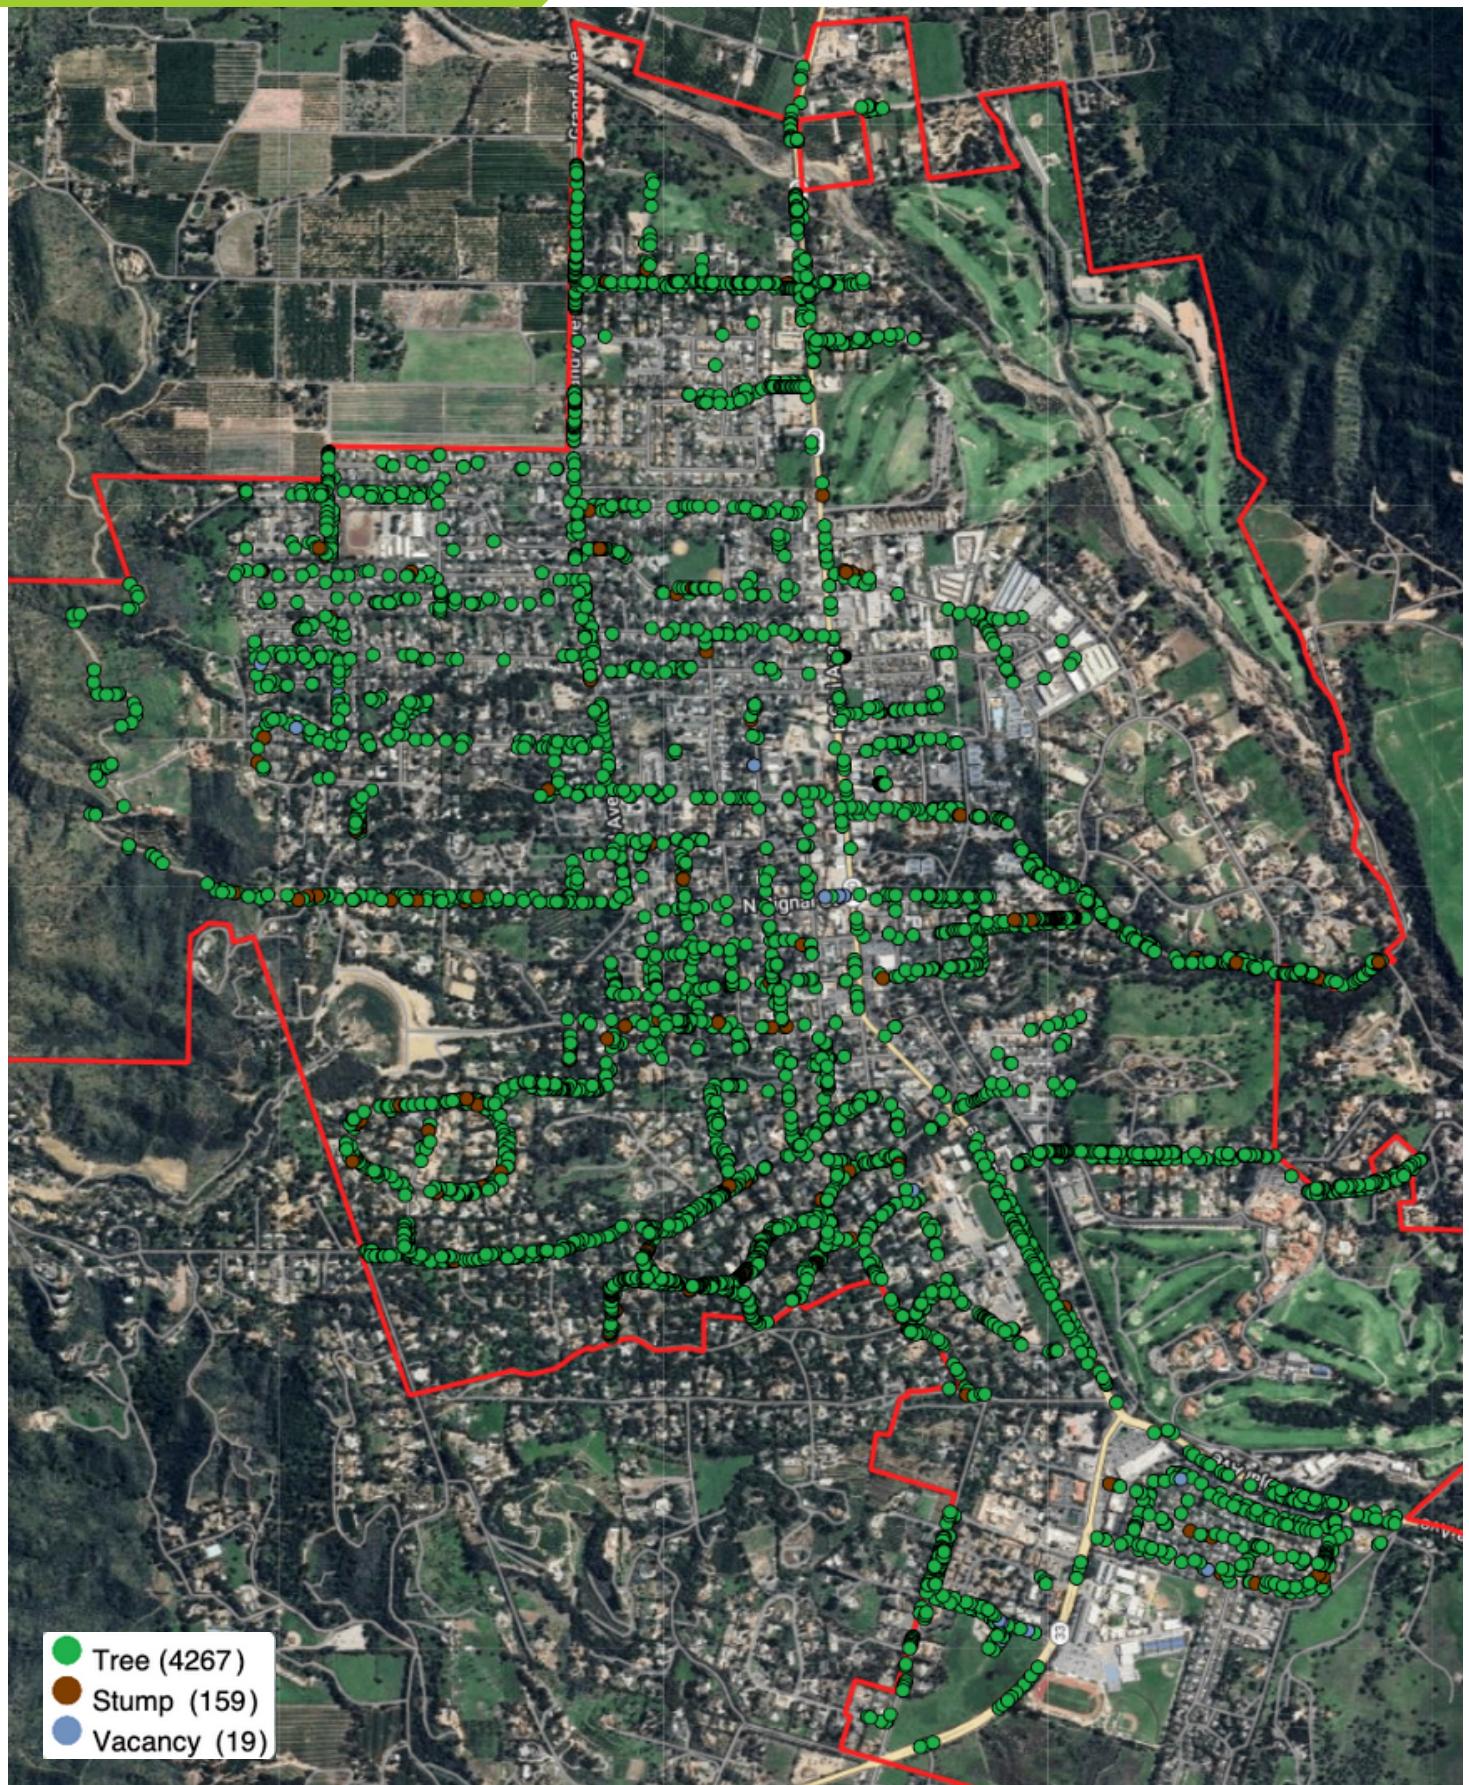

A valuable assessment from a tree survey is the species composition of the trees that are dead or in poor/critical condition. The top 10 species and genus with the most trees in poor, critical, or dead condition are summarized in the tables to the right, order by percentage of poor condition trees to the total count of the species and genus. The full Species and Genus poor condition summary can be found in Appendix C and D respectively.

Top 10	Common Name	Poor/Dead/Critical	Count	% in Poor Condition
